

# Methods of Biomaterials Testing

Special Biology: Blood & Vessel

# Blood Compatibility

Mainly: Inhibition of blood clot formation

# Materials in Bloodflow

**Venous catheter**

**Dialysis shunt**

**Dialysis filter**

**Heart Valves**

**Vascular Stents**

**Cardiac Assist  
Devices**

**Artificial Hearts**

# Blood Compatibility

Cells and proteins come in contact with foreign materials

# The Triade of Virchow

Clottability

Flow Conditions

(Endothelium-)  
Surface Properties

# Red Blood Cells

## Hemolysis

- Reasons
  - Important for polymers (plastiziser)
  - Result of corrosion of metals
  - Mechanically at heart valves
- Measurement
  - Absorption of Hemoglobin
  - Reaction with cyanide and measurement of the absorption of cyan-methemoglobin  $\lambda = 546\text{nm}$
- Consequences
  - Activation of blood platelets and clotting cascade

# White Blood Cells

## Activation of Phagocytes

- Release of reactive oxygen species
  - $2 O_2 + NADPH \rightarrow 2 O_2^- + NADP^+ + H^+$
  - $O_2^- + 2H^+ \rightarrow H_2O_2 + O_2$
  - $H_2O_2 + Cl^- \rightarrow HOCl + H_2O$
- Release of inflammatory cytokines
  - Interleukin 1
  - Interleukin 6
  - $TNF-\alpha$

## Consequences

- Activation of endothelium cells
- Proliferation of vascular smooth muscle cells
- Recruitment and activation of other cells

## Activation of Lymphocytes

- So far not described for implants in the blood

# Reactive Oxygen Species

Because of short lifetime ( $\ll 1$  second) direct measurement is often difficult

- Hydrogen Peroxide
  - Direct measurement

- Other free radicals
  - Detection with luminescent probes (luminol or lucigenin) in real-time
  - Chromogenic or fluorogenic substrates
- Detection of free radicals effects
  - Lipide peroxidation: Malondialdehyde (MDA) formation
    - Direct detection with HPLC
    - Detection with Tiobarbituric acid (pink product)
  - Consumption of scavengers (radical antagonists)
    - Ascorbic acid
    - SH groups (glutathione)

# Thrombocyte Activation

## Reasons

- Activated endothelium cells (expression of vWF)
- Defect of the endothelium cell layer
  - Uncovered collagen, fibronectin und laminin
  - Negatively charged surfaces
- Fibrin and activated clotting factors
- Denatured proteins
- Mediators
  - Noradrenalin
  - ADP
- Decreased blood flow

# Platelet Activation Pathways

# Platelet Activation Pathways

# Thrombocyte Activation

## Consequences

- Aggregation
- Surface adhesion
  - Change in morphology/ spreading
- Release of Serotonin
  - Vasodilatation
- Release of Platelet factor 3
  - Activation of the clotting cascade
- Release of Platelet factor 4
  - Heparin-Inactivation
- Release of growth factors (PDGF, FGF)
  - Proliferation of vascular smooth muscle cells
- Release of RANTES
  - Monocyte recruitment to endothelial cells

## Detection

**Morphology**

**ELISA**

# Protein Adsorption

- Albumin and fibrinogen show competitive behaviour
  - *In vitro* dependent from the salt concentration and buffer system
  - Albumin binds more to hydrophobic surface
  - Fibrinogen binds more to hydrophilic surfaces
- Different behaviour of free and adsorbed fibrinogen
  - Adsorbed fibrinogen activates blood platelets
  - Increased effect by parallel adsorption of a phospholipide (lecithin)
- Threshold Surface Fibrinogen Concentration for Platelet Activation
  - 30 ng/cm<sup>2</sup>

# Serine Proteases

# Testing of the Clotting Cascade

# Tests of the Clotting Cascade

- Global Test: Clotting Time
  - Start the clotting cascade by addition of  $\text{CaCl}_2$
  - Stir the sample and measure the time until a fibrin clot is formed (visually, change of viscosity, turbidimetry (change of transparency))  
⇒ Can be performed with the plasma on the test material or after some incubation of the plasma with the sample
- Modified Global Tests
  - F1+2 fragment: Fragment of prothrombin, which is cleaved off during activation
  - TAT (Thrombin-antithrombin) complex: Further downstream indicator of activated thrombin
- Amount/ activity of individual (pro-)factors in the plasma
  - Mix plasma with factor deficient plasma and determine clotting time
- Activity of some activated factors
  - Chromogenic substrates are available for some factors, e.g. FXIIa: Z-Lys-Phe-Arg-pNA; Thrombin: S-2238
- Clinical clotting tests (TT, PT, aPTT)
  - Mainly test some systems

# Reaction of the Vessel Wall

# Blood Vessel Cells

**Neo-Intima**

**Smooth Muscle Cell-Proliferation**

# Blood Vessel Anatomy

# (Re-)Stenosis Evaluation

- Angiography: X-Ray with contrast media
  - Length and extent of the stenosis
- Intravascular ultrasound
- Histology

# (Re-)Stenosis Evaluation

- Angiography: X-Ray with contrast media
- Intravascular ultrasound
  - Wall thickness
  - (Length of stenosis)
- Histology

# (Re-)Stenosis Evaluation

- Angiography: X-Ray with contrast media
- Intravascular ultrasound
- Histology
  - Wall thickness
  - Measurement of intima and media area
  - Scores for injury or stenosis
  - Inflammatory cells
  - Fibrin deposition
  - Immunochemistry
    - Cell types, proliferation markers, various cytokines

# Endothelial Cells

## Resting State

- Phospholipids on the surface → optimum blood compatible surface

## Stimuli for Activation

- Inflammatory cytokines (IL-1, IL-6, TNF etc)
- Thrombin (Proteinase Activated Receptor PAR-1)
- Low Density Lipoprotein (LDL-Cholesterol)
- Mechanically (?)

## Consequences of Activation

- Expression of E-selectins
  - Leukocyte rolling and adhesion and penetration
- Expression of von Willebrand Factor (vWF)
  - Platelet adhesion and activation
- Production of NO
  - Relaxation of vascular smooth muscle cells

Antibody  
techniques

# Nitric Oxide

- NO is a free radical with extremely short lifetime
- NO has very many signaling functions
- NO is produced by Nitric Oxide Synthase (NOS) in an oxidation of L-arginine to L-citrulline
  - Neuronal NOS: nNOS
  - Inducible NOS: iNOS
  - Endothelial NOS: eNOS
- **Detection**
  - NO sensitive electrodes
  - Measurement of nitrate as stable end product of NO
    - Griess Reaction -> photometrical detection
    - 4,5-diaminofluorescein -> fluorescent detection
  - Molecular biology, RNA-methods for iNOS

# Smooth Muscle Cells

- Usual cells in the Tunica Media
- At inflammatory processes (arteriosclerosis, mechanical irritation) they proliferate forming a *neointima*
- Restenosis tissue is 30% smooth muscle cells, the rest are inflammatory cells
- Analysis
  - Characteristic protein: smooth muscle cell actin
  - Proliferation markers
  - Inflammatory cytokines
  - Growth factors
    - Transforming growth factor beta (TGF- $\beta$ ) provokes SMC growth
    - Vascular endothelial growth factor (VEGF) induces endothelialization and inhibits SMC growth
